An Annotated Checklist of Bird species Recorded from 1st October 2015 – 30th September 2016 Using Social Media.

Tshering Tobgay^{1*}

Oriental Magpie-Robin (Copsychus saularis)

Abstract

The 'Birds of Bhutan' (BoB) is a citizenscience Facebook forum that was created in October 2015. It is a platform for exchanging information related to bird species in Bhutan. The Forum had more than 3000 members as of 30th September, 2016. Members comprised of birders from Bhutan and birding visitors from around the globe. The members voluntarily contribute bird information to the forum along with photographic evidence. This first annual report is synthesized based on the posts made by the members of this online group. The Forum was created with an objective to build and expand the knowledge base on the birds of Bhutan through documentation of bird diversity by observation, photography, and sharing of information. The ultimate aim of the Forum is to promote awareness, educate

people on birds, monitor, and contribute to bird conservation. The Forum also contributes to the creation of knowledge over the years about the birds' migration patterns, breeding habitats, and population trends.

Every post made on the Forum was reviewed by experts and documented.

¹Department of Science, Bajothang Higher Secondary School, Bhutan. *Corresponding author's email tsheringtobgay2@gmail.com

The Forum documented 351 species of birds between 2015 and 2016 out of which a few are threatened bird species in Bhutan.

Keywords: Birds of Bhutan; Facebook; Forum; Social Media

Introduction

The study of birds in Bhutan dates back to the political mission led by R.B Pemberton, an officer in the British Indian Empire, to Bhutan in 1838, where several species of birds were collected (Clement 1992). R.B Pemberton was accompanied by Lieut. Blake as assistant and Dr. William Griffith, a medical officer and a botanist (Ludlow 1937). Despite the statement below made by Pemberton (1865), "Of the birds in Bootan a detailed account will be hereafter given when a competent examination has been effected of the collection made by the Mission during its progress through the country, no report was published and the surviving specimens carry no locality data" (Clement 1992:57), it was only in the mid 1930s, that avifauna of Bhutan became known (Ludlow and Kinnear 1937, 1944). Later, between 1966 and 1973, Salim Ali, S.D. Ripley, and a team from the Zoological Survey of India made six collecting trips to the country (Clements 1992).

Some significant publication about birds of Bhutan in the past include Ludlow *et al.* (1937), Abdulali (1969 -1988), Gole (1981), Khacher (1981), Ripley (1973), Saha (1980), Ali et al. (1983), Ripley (1982), Clements et al. (1986), Dorji (1987), Gaston (1989), Chacko (1991), Wollenhaupt (1991), and Inskipp et al. (1999). Today, with the strengthening of research institutes and the growth of education level in the country, more conservation efforts and related study on biodiversity, especially on birds and their distribution, behaviour, habitat, and migration patterns are carried out. There are several methods to study the ecology of birds. Here, I describe a new approach to studying bird ecology.

The 'Birds of Bhutan' (BoB) Facebook forum, hereafter referred to as the Forum, was formed in October 2015 to provide an opportunity for birders to share their observations online. The Forum's objective is to help people learn about birds in Bhutan and to emphasize the importance of bird conservation. It provides a platform for amateur birders to interact with experts that are also members of the BoB Facebook group. Tourists can also help, in keeing with what Clements said, "If visiting birdwatchers make an effort to go to little-known areas and to publish records of bird species found there, then they will be making a significant contribution to Himalayan ornithology, and be assisting the Royal Government of Bhutan in achieving its aims of conserving this rare resource" (1992:66). The record maintained through this Forum will not only help keep a census of the birds found in Bhutan, it will also help in understanding the distribution, migration patterns, and the population of bird species in the country.

Methods

The data for this Study was obtained from the BoB online forum based on bird photographs posted by members from 1st October 2015 to 30th September 2016. New members to the BoB group were briefed on the objective of the Forum and on how to post images of bird species with the required temporal and spatial information. Members made posts on the Forum at any time with no limitation placed on the number of images posted. Each post made on the Forum was reviewed by bird experts or ornithologists who authenticated the identity of the bird. Bird identification by members were doublechecked and corrected where necessary. The posts were finally compiled in a standard database in Microsoft Excel, specifically looking at species and frequency of sightings, corresponding to seasons and localities. The localities in which the birds were sighted were linked to their districts for accurate analyses. Records without sufficient information were eliminated from the analysis.

Data analysis

The twenty districts within the country have various habitat types. Many towns are small and surrounded by reasonable bird habitat, including primary forest (Clement 1992) that helps to spot the bird much quicker. Images and information about birds found at low-lying places of the southern regions of Bhutan to extremely cold place of the north were posted on the Forum. Some detailed descriptions of birding localities in Bhutan are presented by Clements (1992), Inskipp and Inskipp (1993a and b), Tymstra et al. (1996), and Bishop (1999). The posts on the Forum include common birds in Bhutan such as Eurasian treesparrow (Passer montanus), common myna (Acridotheres tristis,) and redvented bulbul (Pycnonotus cafer). They also include rare birds like white-bellied heron, wards trogon, and pallas's-fish eagle. Most of the birds recorded were from important bird watching areas identified (Figure 1) by

BirdLife International (2017).

The database presented here are from 1st October 2015 to 31st September 2016. The review of 2160 posts made on the Forum during this time ascertained a total of 351 species of birds. Out of 2160 posts, 46 were eliminated from the analysis due to insufficient information such as no photographs, time of sighting, place, and blurred photographs of bird; 35 posts were without date and month of sighting, 9 posts were with blurred photographs and 2 were without photographs. The detailed list of birds recorded on the Forum is provided in the appendix.

Results

A total of 209 landbirds and 42 waterbirds were recorded on the Forum. The Forum received the maximum posts from Thimphu, Punakha and Wangdue Phodrang (Figure 2).

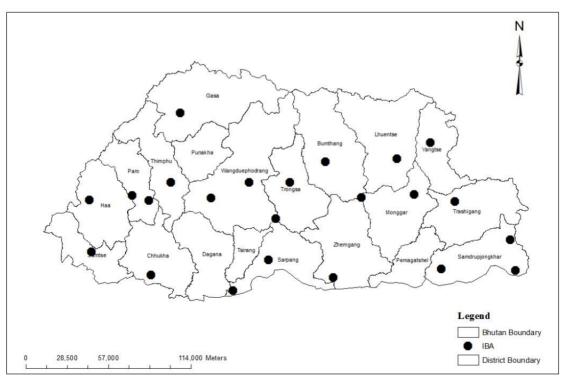

Figure 1: Map showing Important Birdwatching Areas in Bhutan

Short Communication

The data gathered also informed seasonal variation for birding activity in Bhutan. April and September stood out as the most active months for birders (Figure 3).

The Forum received an average of 4 posts per day during its first six months when there were less than 2000 members. With the increase in members, the Forum received an average of 8 daily posts during the last six months of the study period. According to Birdlife International (2017), Bhutan host a significant number of globally threatened birds; 4 species are of critically endangered birds, 15 species of birds in the vulnerable list, and 24 species of birds in the near threatened list. The Forum received a number of the significantly threatened birds posts, validating the presence of these species in Bhutan (Table 3). Their detail sightings were subsequently explained in the 'Annotated Checklist of Critically Endangered, Vulnerable

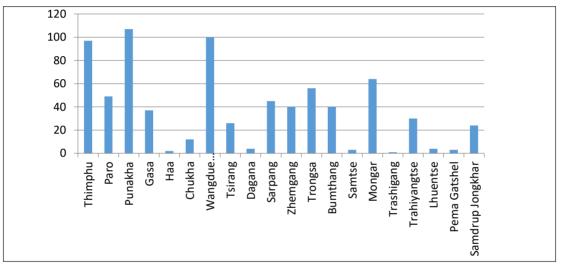

Figure 2: Number of records from each district from October 2015 to 30th September 2016 on the BOB Facebook Forum

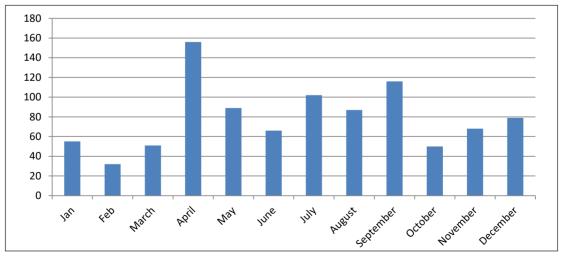

Figure 3: Number of bird species recorded for each month from October 2015 to 30th September 2016

and Near Threatened Birds.' The English and scientific names of birds provided follow the Helm field guide, 'Birds of the Indian Subcontinent' (Grimmett *et al*, 2014).

Table 3: Number of threatened bird species recorded in the Forum from October 2015 to 30th September 2016

SI. No.	Conservation Status	Number of bird species recorded
1	Critically endangered	1
2	Vulnerable	4
3	Near Threatened	9

Annotated Checklist of Critically Endangered, Vulnerable and Near Threatened Birds.

- White-bellied Heron (Ardea insignis) i. observed and recorded was from Phochu, Punakha in November 2015. It was also been sighted for the first time in Trashiyangtse in April 2016 by the faculty and trainees of the UWICER. One adult along with two juveniles were also observed in Sunkosh in the month of June 2016. White-bellied heron has been uplisted from "endangered" to "critically endangered" status in the IUCN Red List of Threatened Species in 2007 because new information on this species indicated that it has an extremely small and rapidly declining population (Biodiversity Action Plan. 2009).
- Beautiful Nuthatch (Sitta Formosa). According to BirdLife International (2017) Species factsheet, this bird species was listed as vulnerable. Observation and record of this bird species was made at Morong on 29 April 2016. Two Beautiful Nuthatch birds were observed and recorded foraging actively with other species of birds. The previously published record of the observation of this bird species was on 30 April 1997 by Bishop in

the same valley (Bishop, 1999).

- Pallas's Fish Eagle iii. (Haliaeetus *leucorvphus).* A single bird of this species was observed and recorded in Punakha during the month of November and December 2015. The species was also observed and recorded in ISWNP and Mongar in the month of April 2016. This bird species was on the vulnerable list according to BirdLife International (2017) Species factsheet. This is due to declining population as a result of the degradation and disturbance of wetlands and breeding sites (BirdLife International 2017).
- Rufous-necked Hornbill (Aceros iv. *nipalensis*). This species of hornbill was listed as vulnerable because it has a small, rapidly declining population as a result of the destruction of evergreen forest and hunting (BirdLife International 2001). A pair of this species was observed and recorded on 21 March 2015 at Wangkha, Chukha. Sighting and record were also made from Nabji, Trongsa in the month of July 2016. The species of this bird is widespread and moderately common in subtropical and warm broad-leaved forest throughout Bhutan (Inskipp et al and Tymstra et al 1993b, 1997).
- Black-necked Crane (Grus nigricollis). V. Overall, the Black-necked cranes' arrival in Bhutan has remained consistent. The arrival of the species in Phobjikha saw an increasing trend, while arrival in Bumdeling, Trashiyangtse has been declining steadily (RSPN, 2011). In the month of February, a presence of single species of this bird was also recorded from Paro. Observation record of the species was made from Phobjikha, Bumdeling and Bumthang in the months of October 2015 - February 2016. According to IUCN Red List of Threatened Species 2017, due to rapid loss of wetlands and changes in agricultural practices in this bird species,

both breeding and wintering ground, the conservation status of it was listed under vulnerable.

- vi. Satyr Tragopan (*Tragopan satyra*). Although this bird was listed near threatened (Collar et al. 1994), the species appears to be widespread and moderately common in Bhutan (Bishop 1999). In last one year, the post made on the Forum had observed and recorded only a few incidences of seeing this bird species. The observations and records were made from Bumthang, Dochula, and Sengor in the months of April and May 2016.
- vii. Great Hornbill (Buceros bicornis). Since the species occurs at low densities and is patchily distributed, it is considered to be declining moderately rapidly to rapidly throughout its range (BirdLife International 2017). Therefore, this bird species was listed as near threatened according to the IUCN Red List of Threatened Species 2017. Single species of this bird flying towards the north of Gelephu Higher Secondary School, Sarpang on 18 January 2016 was observed and recorded. The species had also been observed and recorded in the month of March 2016 from Samdrup Jongkhar and in August month from Wangdue Phodrang and Zhemgang districts.
- viii. Yellow-rumped Honeyguide (*Indicator xanthonotus*). The conservation status of this species of bird was listed as near threatened due to declining population as a result of habitat loss and honey extraction by humans (BirdLife International 2017). Observation record of this bird was made in the month of April 2016 at Namling.
- ix. Ward's Trogon (*Harpactes wardi*). Single species of this bird was observed and recorded from JSWNP, Trongsa, in the month of January 2016. This bird species conservation status was listed as near threatened due to rapid loss of habitat,

according to BirdLife International (2017) Species factsheet.

- x. Northern Lapwing (*Vanellus vanellus*). Single bird of this species was observed and recorded in Wangchhu, Thimphu in December 2015. The species was categorized under near threatened list by IUCN Red List of Threatened Species 2017, due to a decrease in the population size.
- River Lapwing (Vanellus duvaucelii). Four xi. numbers of this bird species was observed and recorded in Babesa, Thimphu in February 2016. It was also common to be observed in Punatshangchhu river between the months of September to May. The earlier published records of this bird species include observation by P. Gole at Manas and Sankosh Rivers (Scott 1989). mention of its occurrence in Bhutan (Ali & Ripley, 1983) and observation in 1992 at Wangdue Phodrang and Gelephu in the month of March (Clement 1992). According to BirdlLife International 2016, this species has been uplisted to Near Threatened on the basis that it is expected to undergo a moderately rapid population decline over the next three generations owing to human pressures on riverine ecosystems and the construction of dams.
- xii. Himalayan Vulture (Gyps himalayensis). The conservation status of this bird species was listed as near threatened according to BirdLife International (2017) Species factsheet. It was suspected that the bird will undergo a moderately rapid population decline over the next three generations owing to the impacts of diclofenac use in livestock, a drug that has caused drastic declines in other *Gyps* species and appears to be fatal to this species when ingested (BirdLife International 2017). This bird species observation and the record was made at Pelela, Wangdue Phodrang in February 2016. Four numbers of this species were spotted at the place.

- xiii. Bearded Vulture (*Gypaetus barbatus*). Single record of the observation of this bird species was made from Laya, Gasa in September 2016. This species was uplisted to Near Threatened by the IUCN Red List of Threatened Species 2017, due to a moderately rapid population decline over the past three generations.
- xiv. Alexandrine Parakeet (*Psittacula eupatria*). Four numbers of this species was observed and recorded near Gelephu Higher Secondary School, Sarpang, perched on the Arecanut plant (*Areca catechu*) on 18 December 2015. An observation of this bird species at the same place was recorded during the was sighted in the month of August 2016. This bird was listed as near threatened by the IUCN Red List of Threatened Species 2017. This is due to the species undergoing a moderately rapid population decline owing to on-going habitat loss, persecution, and trapping pressure (BirdLife International 2017).

Conclusion

Bhutan has a rich diversity of flora and fauna species. According to the Birdlife International (2013), Bhutan lies in the range of endemic bird areas (EBA) of Eastern Himalayas and has 23 important birding areas (IBA) within the country that host varieties of bird species. Due to the limited studies and exploration of biodiversity in Bhutan, there is still a huge gap in the field of ornithology.

The fast pace of development taking place and climatological factors will be the key factor in determining the status of birds in Bhutan. It has now become more important for Bhutan to endure in conservation efforts of birds and its habitat. Here, we described a social media platform to consolidate observations by citizens in a framework with rigorous verification of data integrity. Such approaches help build a dataset for birds, where every citizen who enjoys watching birds can contribute their observation record directly through the simple platform of social media. Later, these data sets gathered will provide critical information to guide future research and conservation efforts.
